Multistage pumps

NEW multistage, high-pressure pumps from APE Pumps are available on the local market. APE Pumps is a major contributor to South Africa's premium pump engineering industry, and is widely acknowledged as a leader in vertical turbine pump manufacture. The multistage, high-pressure pumps deliver up to 900 m³/h at heads of up to 1 200 m. An enlarged shaft section in all models ensures vibration-free running, with a balancing disc accommodating the additional axial-thrust balancing required for the high output pressures. Shaft sealing is either by stuffing box packing or by mechanical seal, and bearing housings are protected against the ingress of spray water by means of lip seals.
